Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Primers T41001-T41382 are derived from novel human gene signature (GS) sequences which did not match with sequences deposited in Genbank release 76. The GS sequences (T19001-T26837) were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes antisense oligonucleotides which modulate the expression of novel anti-apoptotic bcl-2-related proteins. The antisense oligonucleotides can be used as therapeutic agents to prevent or delay inflammation or tumour formation by promoting apoptosis in human cells or tissues. They can also be used as research agents to establish the function of particular genes and as diagnostic agents in sandwich assays for detecting the level of novel anti-apoptotic bcl-2-related proteins in a sample. The antisense oligonucleotides given in the present invention were designed to target human Al and mcl-1 anti-apoptotic bcl-2-related protein nucleotide sequences. The present sequence represents a PCR probe for the human Al nucleotide sequences.
                                                                                                                                                                                                                                                                                                                                                       Identifying gene signatures in 3'-directed human cDNA library for diagnosis of abnormal cell function, by preparing cDNA that reflects relative abundance of corresp. mRNA in specific human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cell typing;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human gene signature HUMGS01288-derived sense primer.

                 Primers T41001-T41382 are derived from novel human gene signature (GS) sequences which did not match with sequences deposited in Genbank release 76. The GS sequences (T19001-T26837) were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types. The primers T41123-4 amplify clone pm2245 which comprises the GS HUMGS001288 (T20288), located on chromosome 10.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gene signature; messenger RNA; mRNA; relative human; cloning; mapping; non-biased library; non-biased relation; primer;
                                                                                                                                                                                                                                                                      Identifying gene signatures in 3'-directed human cDNA library for diagnosis of abnormal cell function, by preparing cDNA that reflects relative abundance of corresp. mRNA in specific human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAT41124 standard; DNA; 20 BP.

                                                                                                                                                                                                                                                                                                                             The present invention describes antisense oligonucleotides which modulate the expression of novel anti-apoptotic bcl-2-related proteins. The antisense oligonucleotides can be used as therapeutic agents to prevent or delay inflammation or tumour formation by promoting apoptosis in human cells or tissues. They can also be used as research agents to establish the function of particular genes and as diagnostic agents in sandwich assays for detecting the level of novel anti-apoptotic bcl-2-related proteins in a sample. The antisense oligonucleotides

                                                        AAZ39070 standard;
                                                                                                                                                                                                                                                                          given in the present invention were designed to target human Al and mcl-l anti-apoptotic bcl-2-related protein nucleotide sequences. The present sequence represents an antisense oligonucleotide for the human Al nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense oligonucleotides which modulate the expression of novel anti-apoptotic bcl-2-related proteins are useful for inducing apoptosis and treating associated diseases e.g. cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; Al; anti-apoptotic; bcl-2-related protein; antisense inhibition; mcl-1; apoptosis; cancer; antiinflammatory; cytostatic; tumour; inflammation; diagnosis; phosphorothloate; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes antisense oligonucleotides which modulate the expression of novel anti-apoptotic bol-2-related proteins. The antisense oligonucleotides can be used as therapeutic agents to prevent or delay inflammation or tumour formation by promoting apoptosis in human cells or tissues. They can also be used as research agents to establish the function of particular genes and as diagnostic agents in sandwich assays for detecting the level of novel anti-apoptotic bcl-2-related proteins in a sample. The antisense oligonucleotides given in the present invention were designed to target human Al and mcl-1 anti-apoptotic bcl-2-related protein nucleotide sequences. The present sequence represents an antisense oligonucleotide for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antisense oligonucleotides which modulate the expression of novel anti-apoptotic bcl-2-related proteins are useful for inducing apoptosis and treating associated diseases e.g. cancer - \frac{1}{2}

The antisense oligonucleotides can be used as therapeutic agents to prev or delay inflammation or tumour formation by promoting apoptosis in human cells or tissues. They can also be used as research agents to establish the function of particular genes and as diagnostic agents sandwich assays for detecting the level of novel anti-apoptotic bcl-2-related proteins in a sample. The antisense oligonucleotides

The present invention describes antisense oligonucleotides which the expression of novel anti-apoptotic bcl-2-related proteins. The antisense oligonucleotides can be used as therapeutic agents to gor delay inflammation or tumour formation by promoting apoptosis human cells or tissues. They can also be used as research agents establish the function of particular genes and as diagnostic agent

                                                                                                                                                                                                                                                    or delay inflammation or tumour formation by promoting apoptosis in human cells or tissues. They can also be used as research agents to establish the function of particular genes and as diagnostic agents sandwich assays for detecting the level of novel anti-apoptotic bel-2-related proteins in a sample. The antisense oligonucleotides given in the present invention were designed to target human Al and mcl-1 anti-apoptotic bcl-2-related protein nucleotide sequences. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes antisense oligonucleotides which modulate the expression of novel anti-apoptotic bci-2-related proteins. The antisense oligonucleotides can be used as therapeutic agents to prevent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antisense oligonucleotides which modulate the expression of novel anti-apoptotic bcl-2-related proteins are useful for inducing apo and treating associated diseases e.g. cancer -
                                                                                                                             Sequence
                                                                                                                                                                                            present sequence represents an antisense oligonucleotide for the human Al nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 21; Column

establish the function of particular genes and as diagnostic agents sandwich assays for detecting the level of novel anti-apoptotic bcl-2-related proteins in a sample. The antisense oligonucleotides given in the present invention were designed to target human Al and mcl-1 anti-apoptotic bcl-2-related protein nucleotide sequences. The present sequence represents an antisense oligonucleotide for the

Ax Antisense oligonucleotides which modulate the expression of novel pr and treating associated diseases e.g. cancer - XX

Claim 21; Column 27; 28pp; English.

XX

Claim 21; Column 27; 28pp; English.

XX

Crime present invention describes antisense oligonucleotides which modulate CC the expression of novel anti-apoptotic bcl-2-related proteins. The CC antisense oligonucleotides can be used as therapeutic agents to prevent CC or delay inflammation or tumour formation by promoting apoptosis in CC bundan cells or tissues. They can also be used as research agents to cc establish the function of particular genes and as diagnostic agents in CC sandwich assays for detecting the level of novel anti-apoptotic cc cc l-2-related proteins in a sample. The antisense oligonucleotides can be used as research agents in CC given in the present invention were designed to target human Al and CC mcl-1 anti-apoptotic bcl-2-related protein nucleotide sequences. The present sequence represents an antisense oligonucleotide for the present sequence.
